Agreement: I would like a sheltered gazebo to be added to Pitmedden Park.

A brief note on how to interpret the tables and graphical information above:

The statistics section at the top of each segment of question analysis shows the number of valid responses (where someone provided an answer) and the number of missing responses (where the respondent did not give an answer).

The frequency tables for each question, below the statistics table, indicate the number and percentage of respondents who chose each option.

- The **Frequency** (1) and **Percent** (2) columns in the tables indicate (1) the number of responses in each response option and (2) the percentage of respondents who chose each response option. Both columns include the missing answers for that question as part of the total response set. In short, **Frequency** is how many people gave the answer and **Percent** is the portion of people who answered the questionnaire in general that gave the answer.
- The **Valid Percent** column indicates the percentage of responses in each option out of those who did respond to the question. For example, if in a survey of 80 respondents, 70 answered Question 1 and 20 of those respondents chose Option A, the valid percent for Option A would be 28.6%, calculated by dividing the 20 given responses by the 70 valid responses to the question and ignoring the 10 missing responses. In short, **Valid Percent** is the portion of people who chose an answer out of those who answered the question.
- The **Cumulative Percent** column informs about the percent of responses that fall in multiple categories. For example, for level of agreement questions, if the cumulative percent in the 'Agree' row is 60%, it means that 60% of respondents either chose 'Agree' or the row above it, 'Agree Strongly'. In short, **Cumulative Percent** groups the valid percent of multiple answers into a larger portion out of the question respondents.

The frequency tables for 'select all that apply' questions, such as the 'What would you like to see as part of a health and wellbeing centre at The Medan Centre?' question above, are read slightly different than the frequency tables above.

- The **Frequency** (1) and **Percent** (2) columns in the table indicate (1) the number of respondents that selected that response option and (2) the portion out of all the given answers to a question that fall in each answer option.

- The **Percent of Cases** column indicates the portion of valid cases (those who answered the question) that chose that response option. As respondents can select multiple options for this kind of question, the percentages of all the answers add up to more than 100%. If 47 out of 86 respondents answered a question, the **Percent of Cases** column indicates the portion of the 47 respondents that chose a given answer. Some of those same respondents could have also chosen additional answer options. In short, **Percent of Cases** is the portion of valid respondents that gave that answer.

The bar and pie charts for the different results are graphical representations of the **valid percentages** of each response for a question and can be read as such.

The bar charts for the 'select all that apply' questions are slightly different. The percentages in each bar indicate the portion of total respondents (including missing cases) that gave a given answer option.

A note on the 'Where are new play facilities most needed?' question above:

This was a 'select all that apply' question with three named options (Pirate Park, Pitmedden Park, and The small parks behind Pitmedden Hall) and a write-in 'Other' option. For those that responded 'Other' and wrote in an additional area, they were categorized as 'Skate park' and 'Near Coffee Apothecary' and added as categories above to add greater detail to the statistics.
